

BEV Digital: Rwanda's Digital Nervous System

Sovereign product identity and supply chain intelligence for East Africa's FMCG markets.

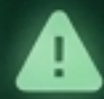

Kezah Kayitesi | Kigali, Rwanda | March 2026

Rwanda's \$2.1B FMCG market operates with a critical infrastructure gap.

Which products on shelves carry valid Rwanda FDA certification?

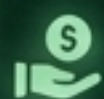

How can authentic products be distinguished from counterfeits in the market?

When a contaminated batch is detected, how quickly can every holder be notified?

How much of the market moves through channels invisible to the tax authority?

Which small distributors are creditworthy but permanently excluded from finance?

\$2.1B Rwanda FMCG market (2026).

80% of FMCG trade is invisible to authority.

Rwanda does not have a digital nervous system connecting its supply chains.

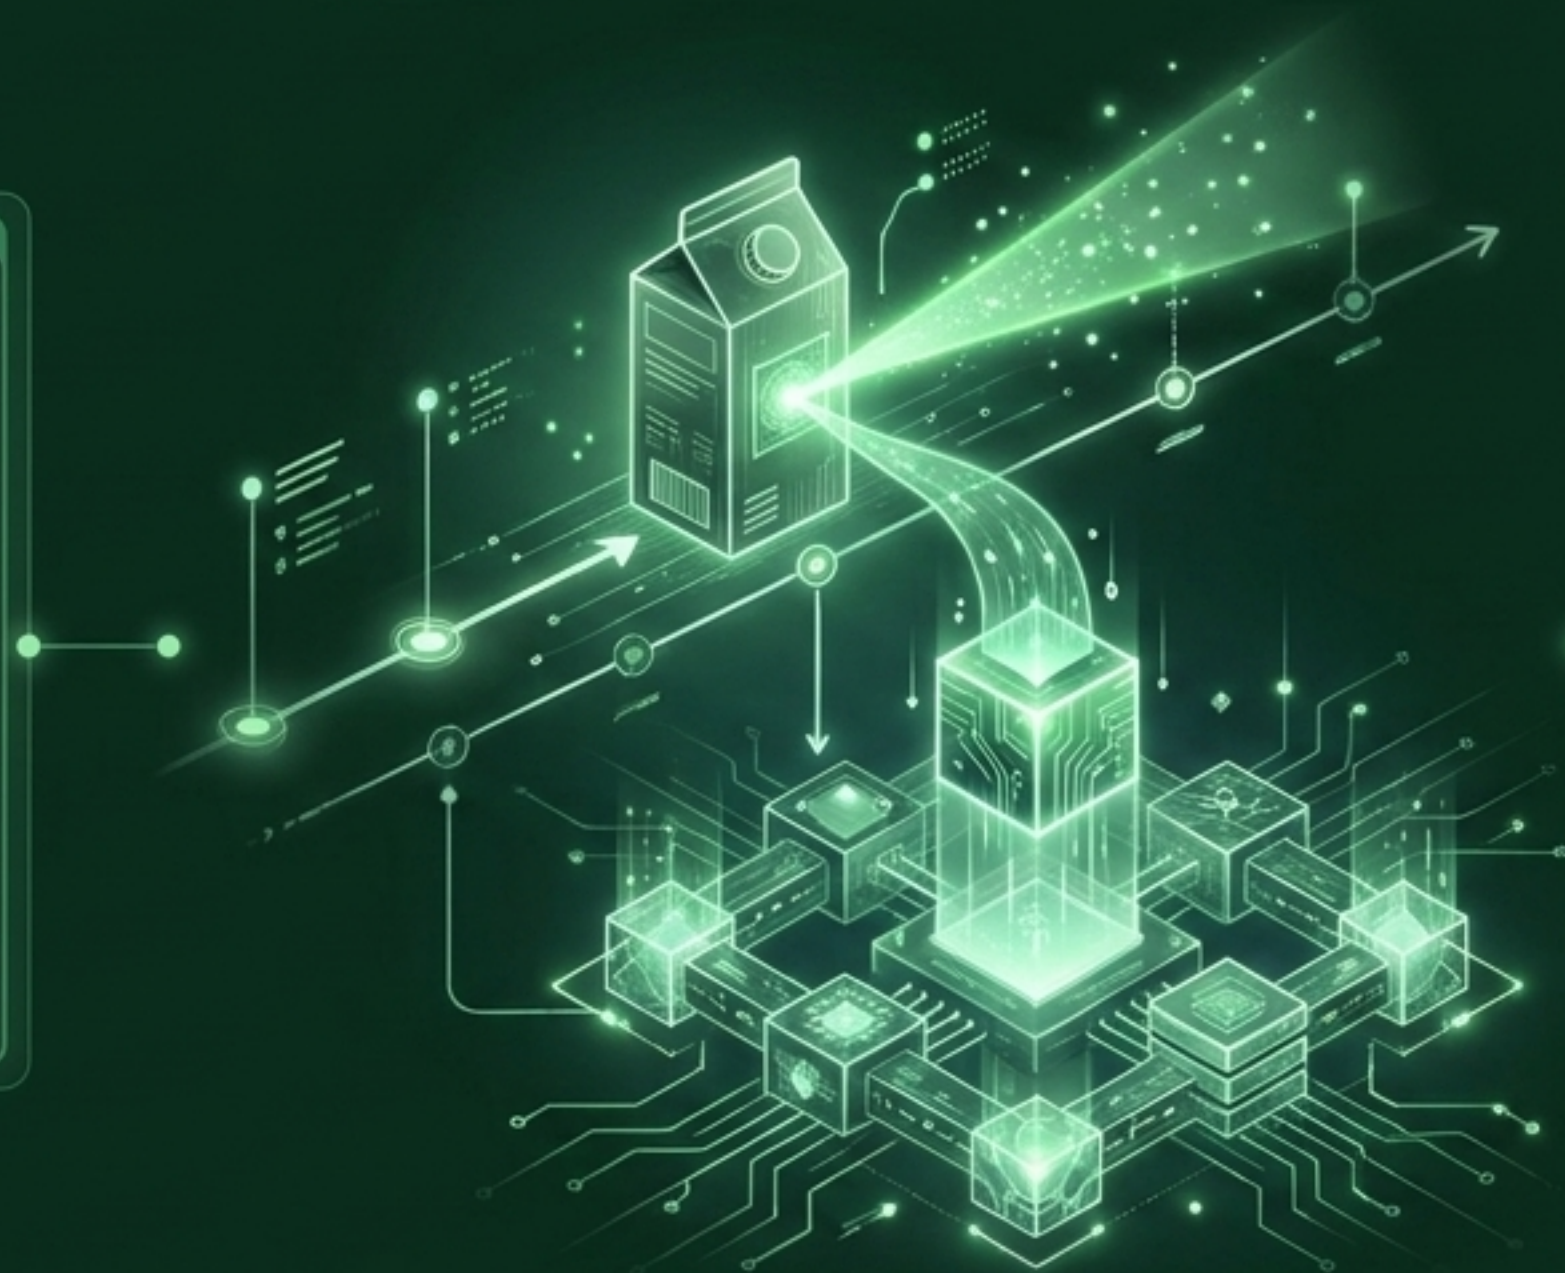

BEV proposes to build one.

BEV Digital is not software; it is sovereign digital infrastructure.

The Core Mechanism

BEV assigns a cryptographic digital identity to every product at the factory.

Every handoff—factory to distributor, distributor to retailer, retailer to consumer—records a verified, tamper-proof event on an append-only ledger.

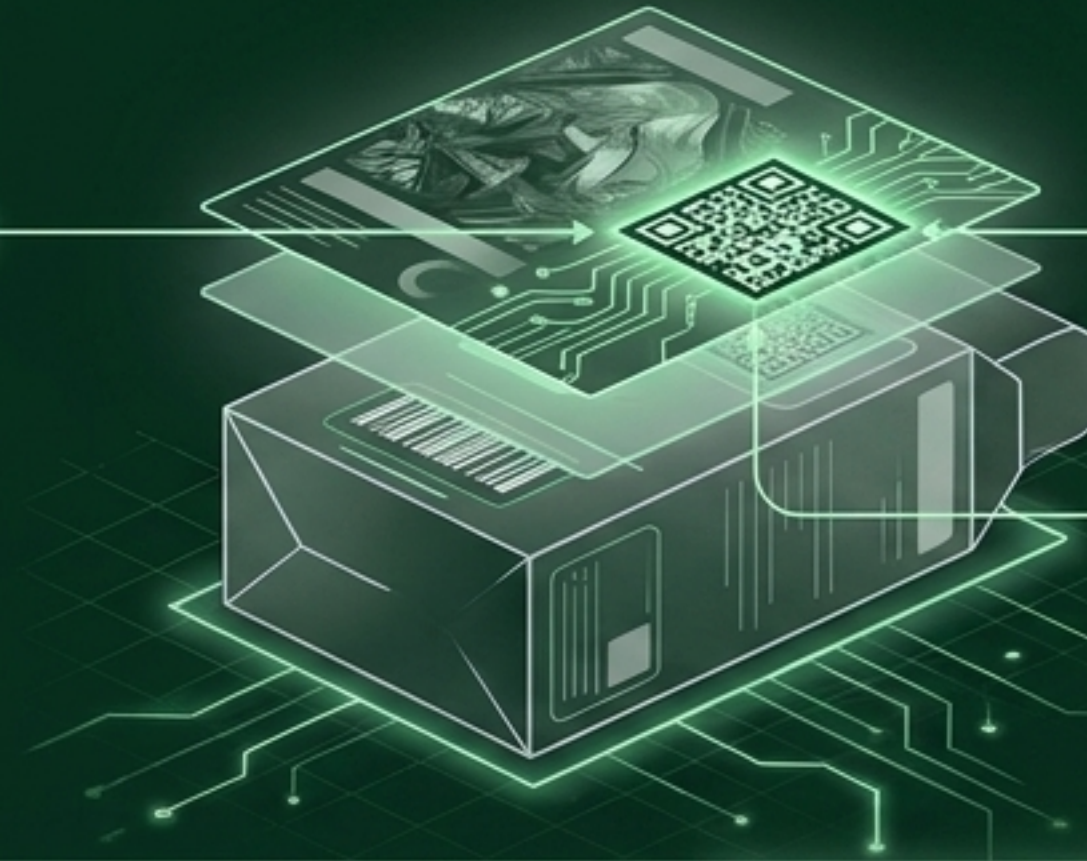

The Result

A living, auditable map of Rwanda's product economy in real time.

Global Precedent: The EU Digital Product Passport mandates traceability for all goods entering Europe by 2027. Rwanda has the opportunity to build this natively, ahead of the curve.

Cryptographic unit identity complements GS1 to create a complete provenance system

Design-Stage Integration:
Delivered as a print-ready file to packaging suppliers. BEV is the sole issuing authority.
(Not a sticker).

HMAC-SHA256 Cryptography:
Unit-level security.

Clone Detection: System fires an immediate alert if the same code appears in two impossible locations simultaneously.

GS1 Barcode

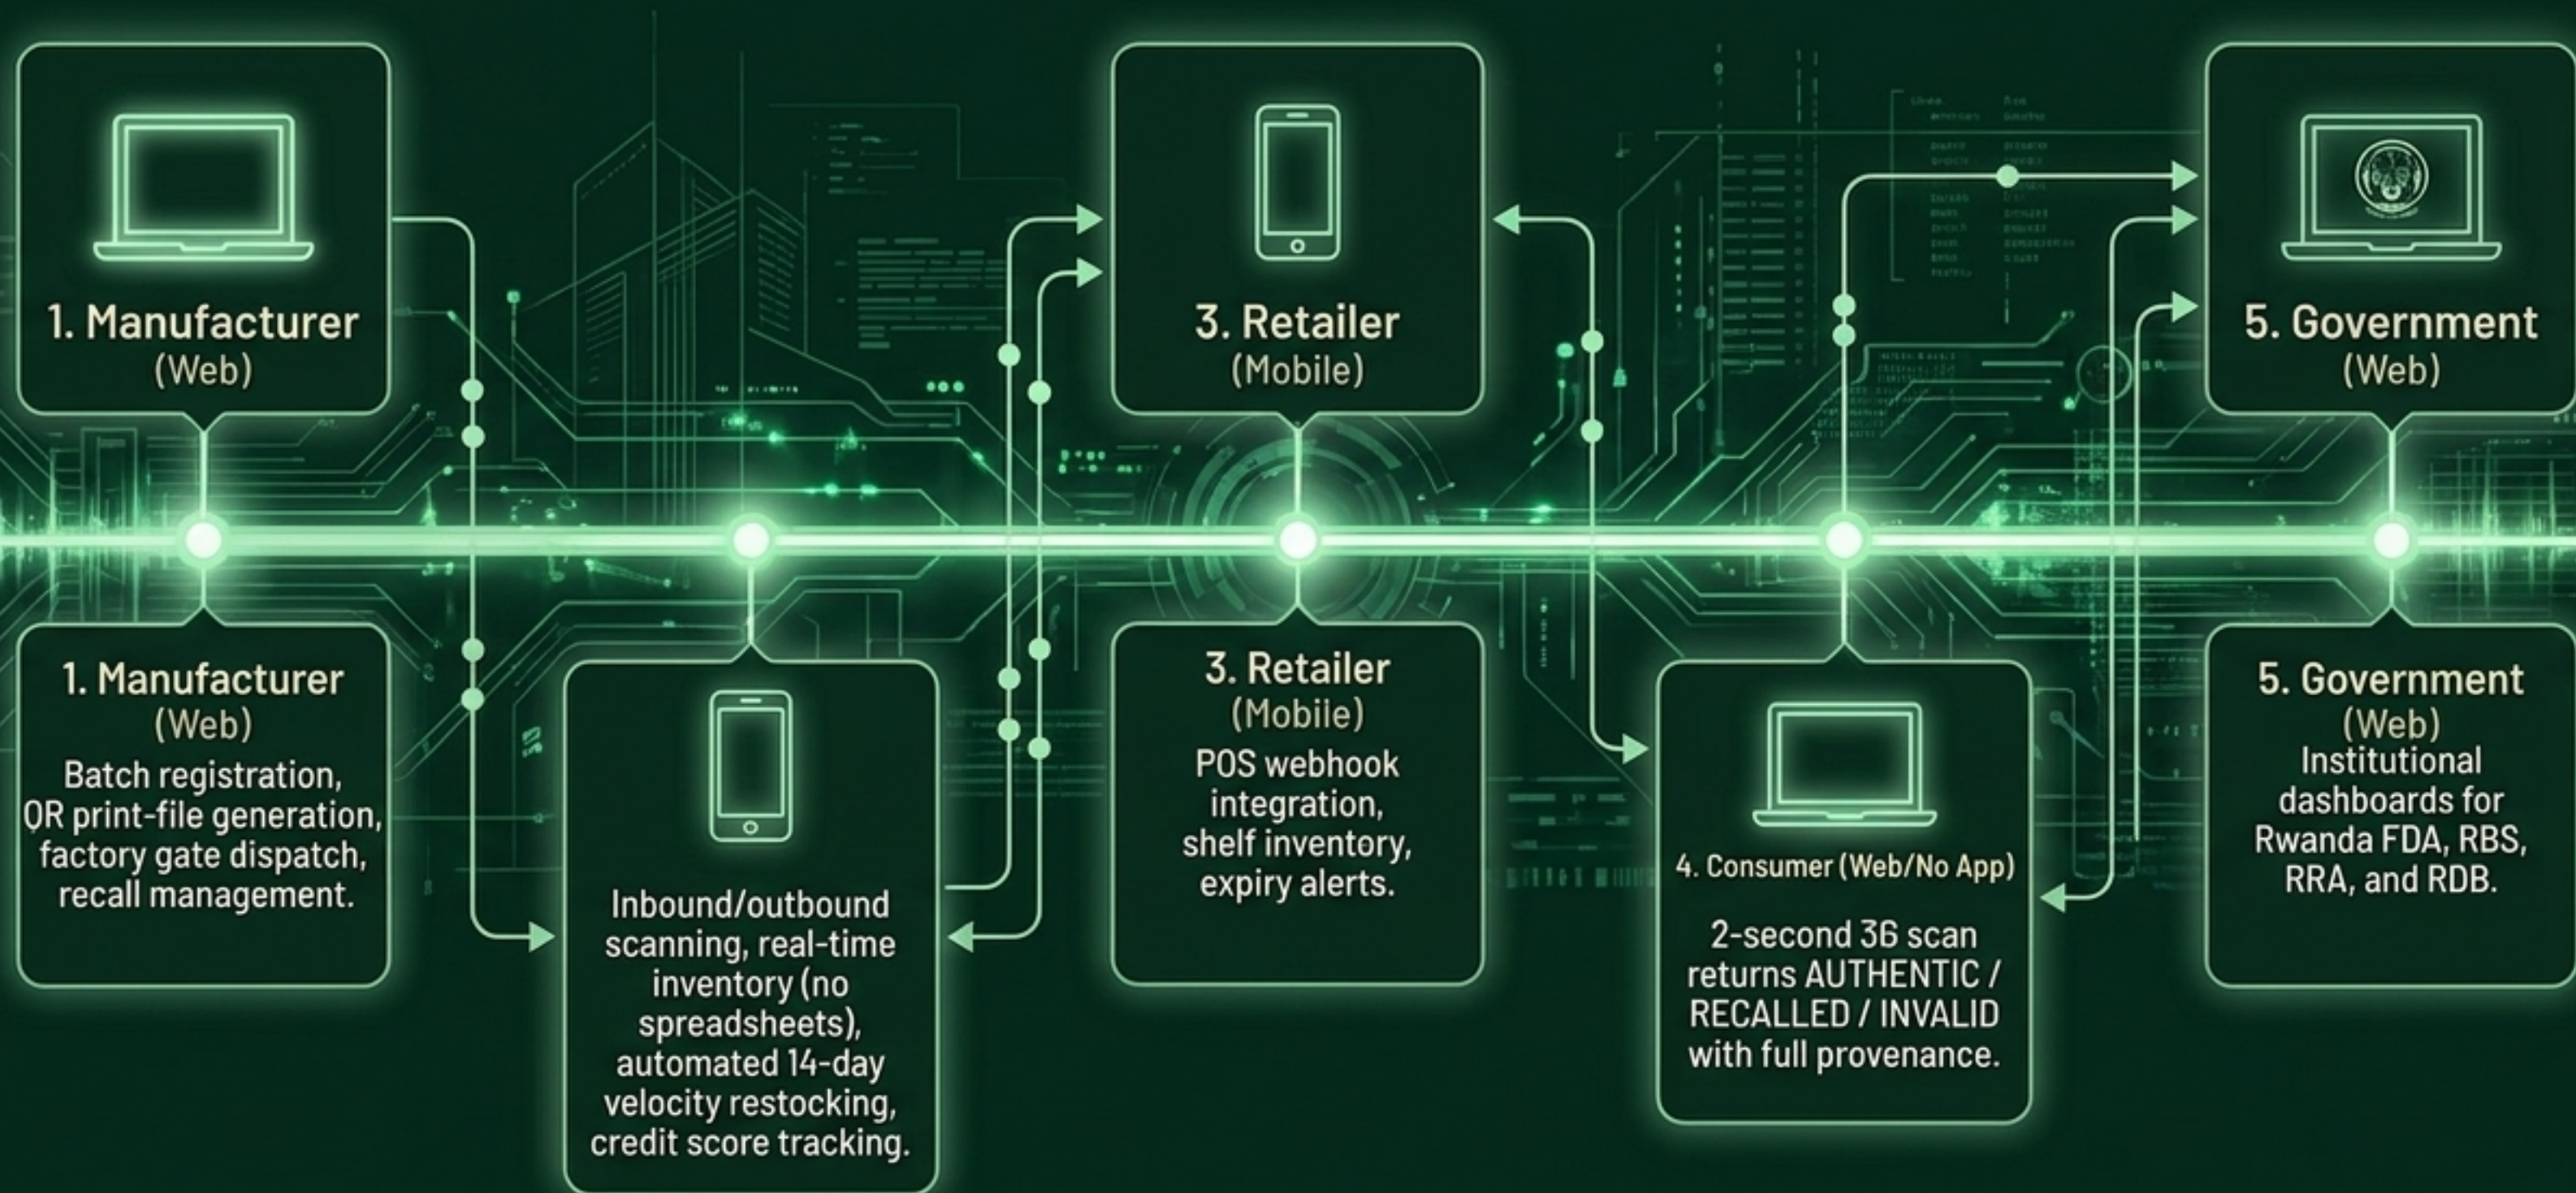

Identifies the Class / GTIN
(What the product is)

BEV QR Code

Authenticates the Unit
(Is this specific item genuine, and where has it been?)

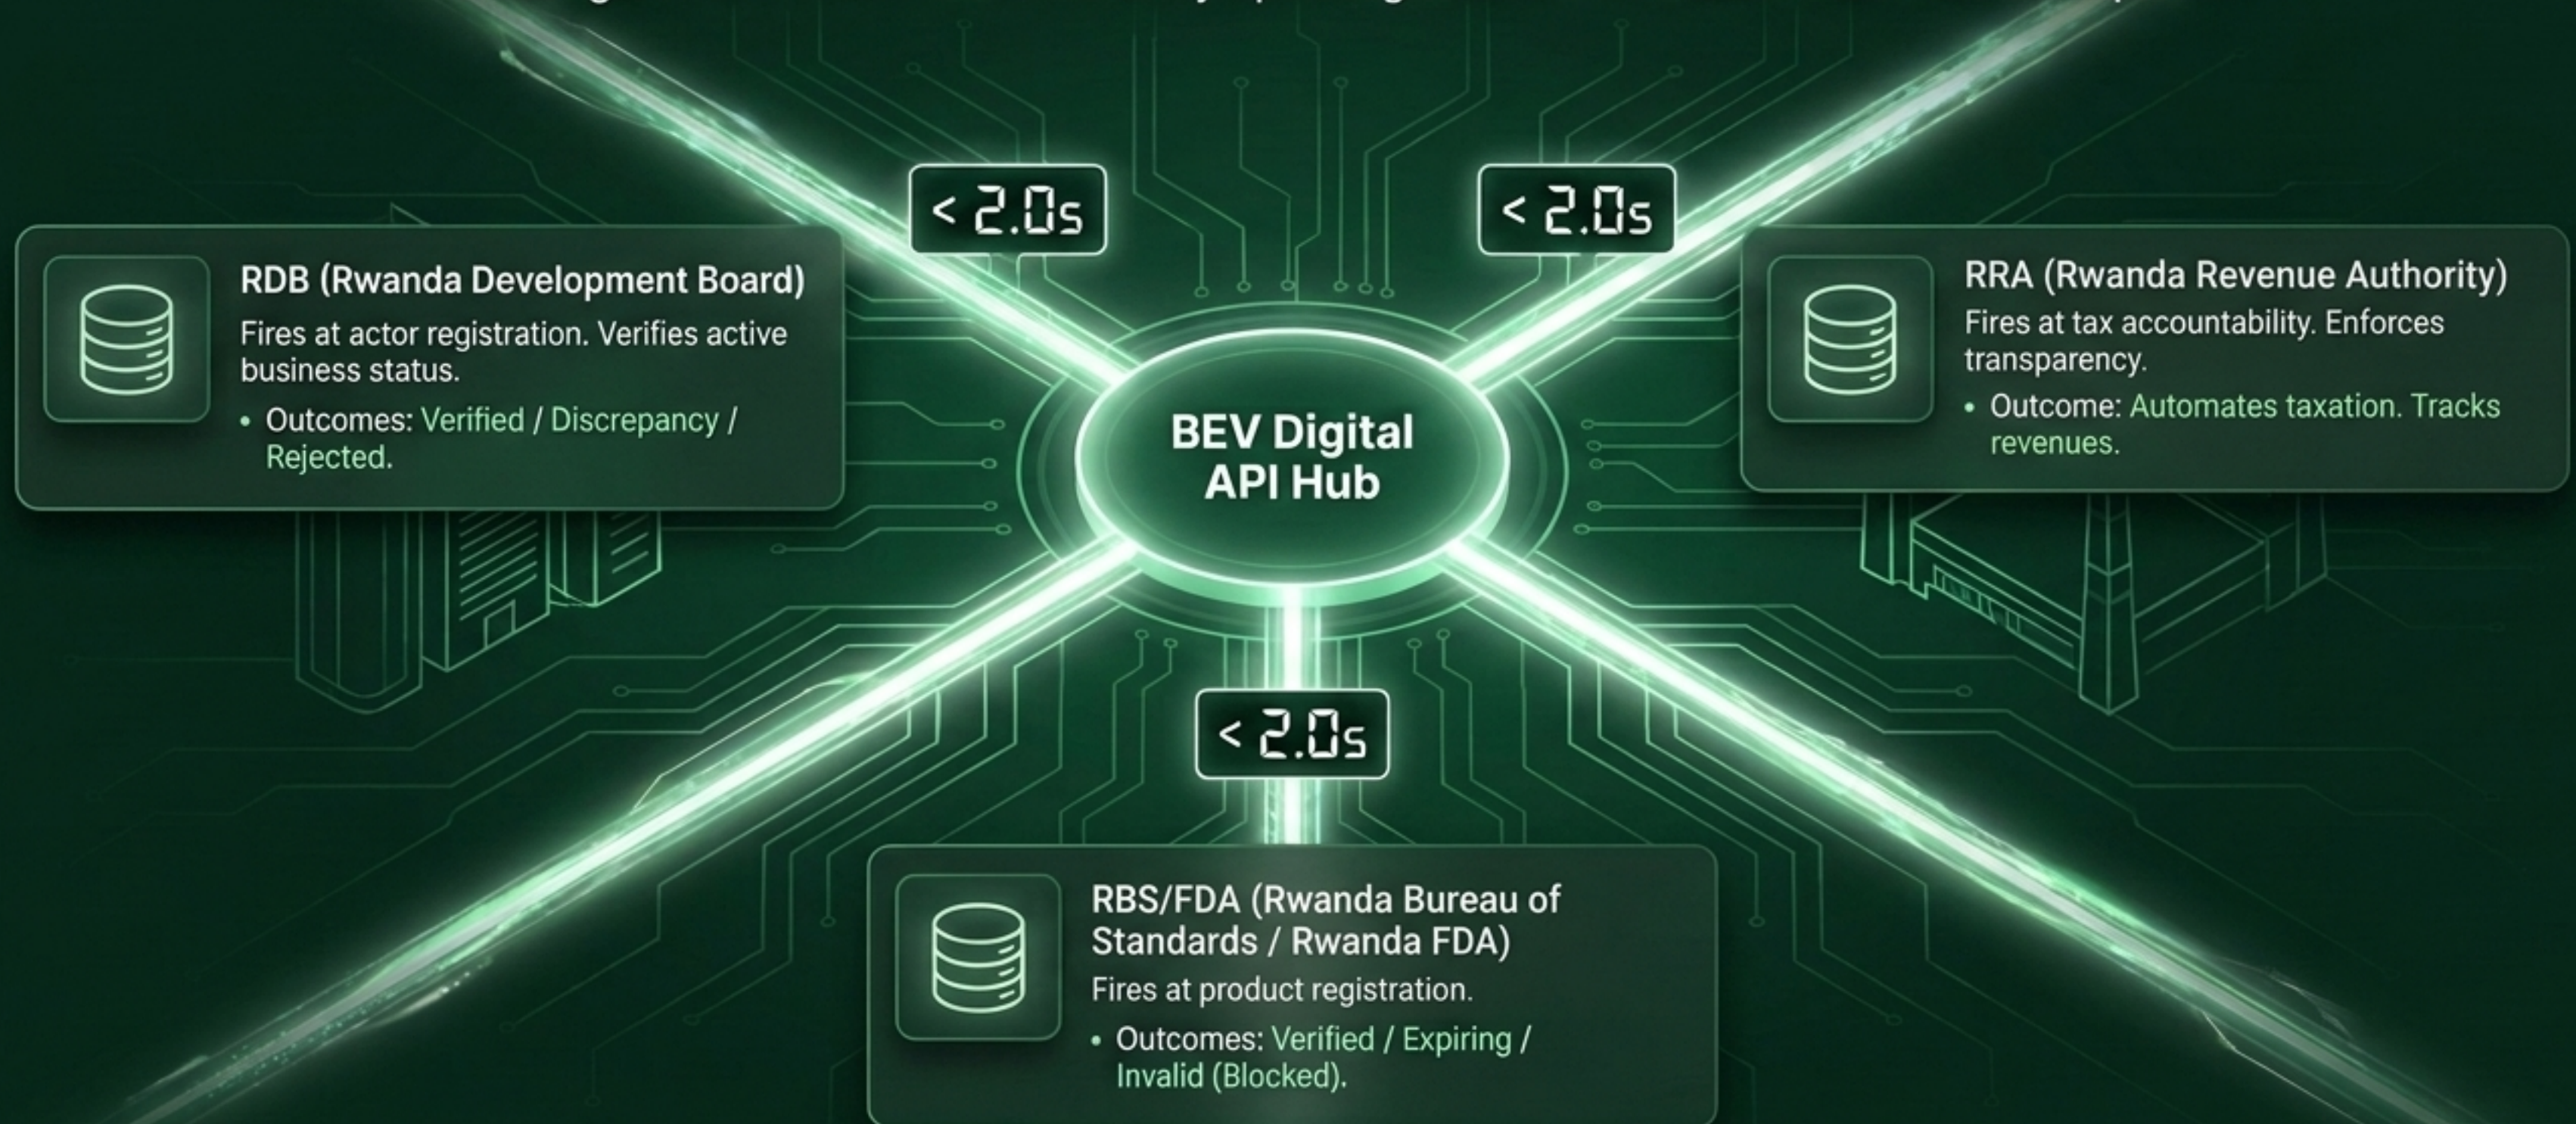

Note: BEV QRs are GS1 Digital Link compliant.

Five dedicated portals track the complete product lifecycle on an immutable ledger.

The platform acts as a digital triangulation hub for automated regulatory compliance.

Three background API checks fire instantly upon registration. No human intervention required.

Consumer protection transitions from manual inspection to proactive, real-time enforcement.

Instant Certification

Inspectors scan any shelf product for instant, machine-readable digital confirmation of FDA authorization and expiration status.

Real-time Market Surveillance

A live dashboard maps every registered product. Counterfeits failing QR checks are flagged automatically.

60-Second Recall Execution

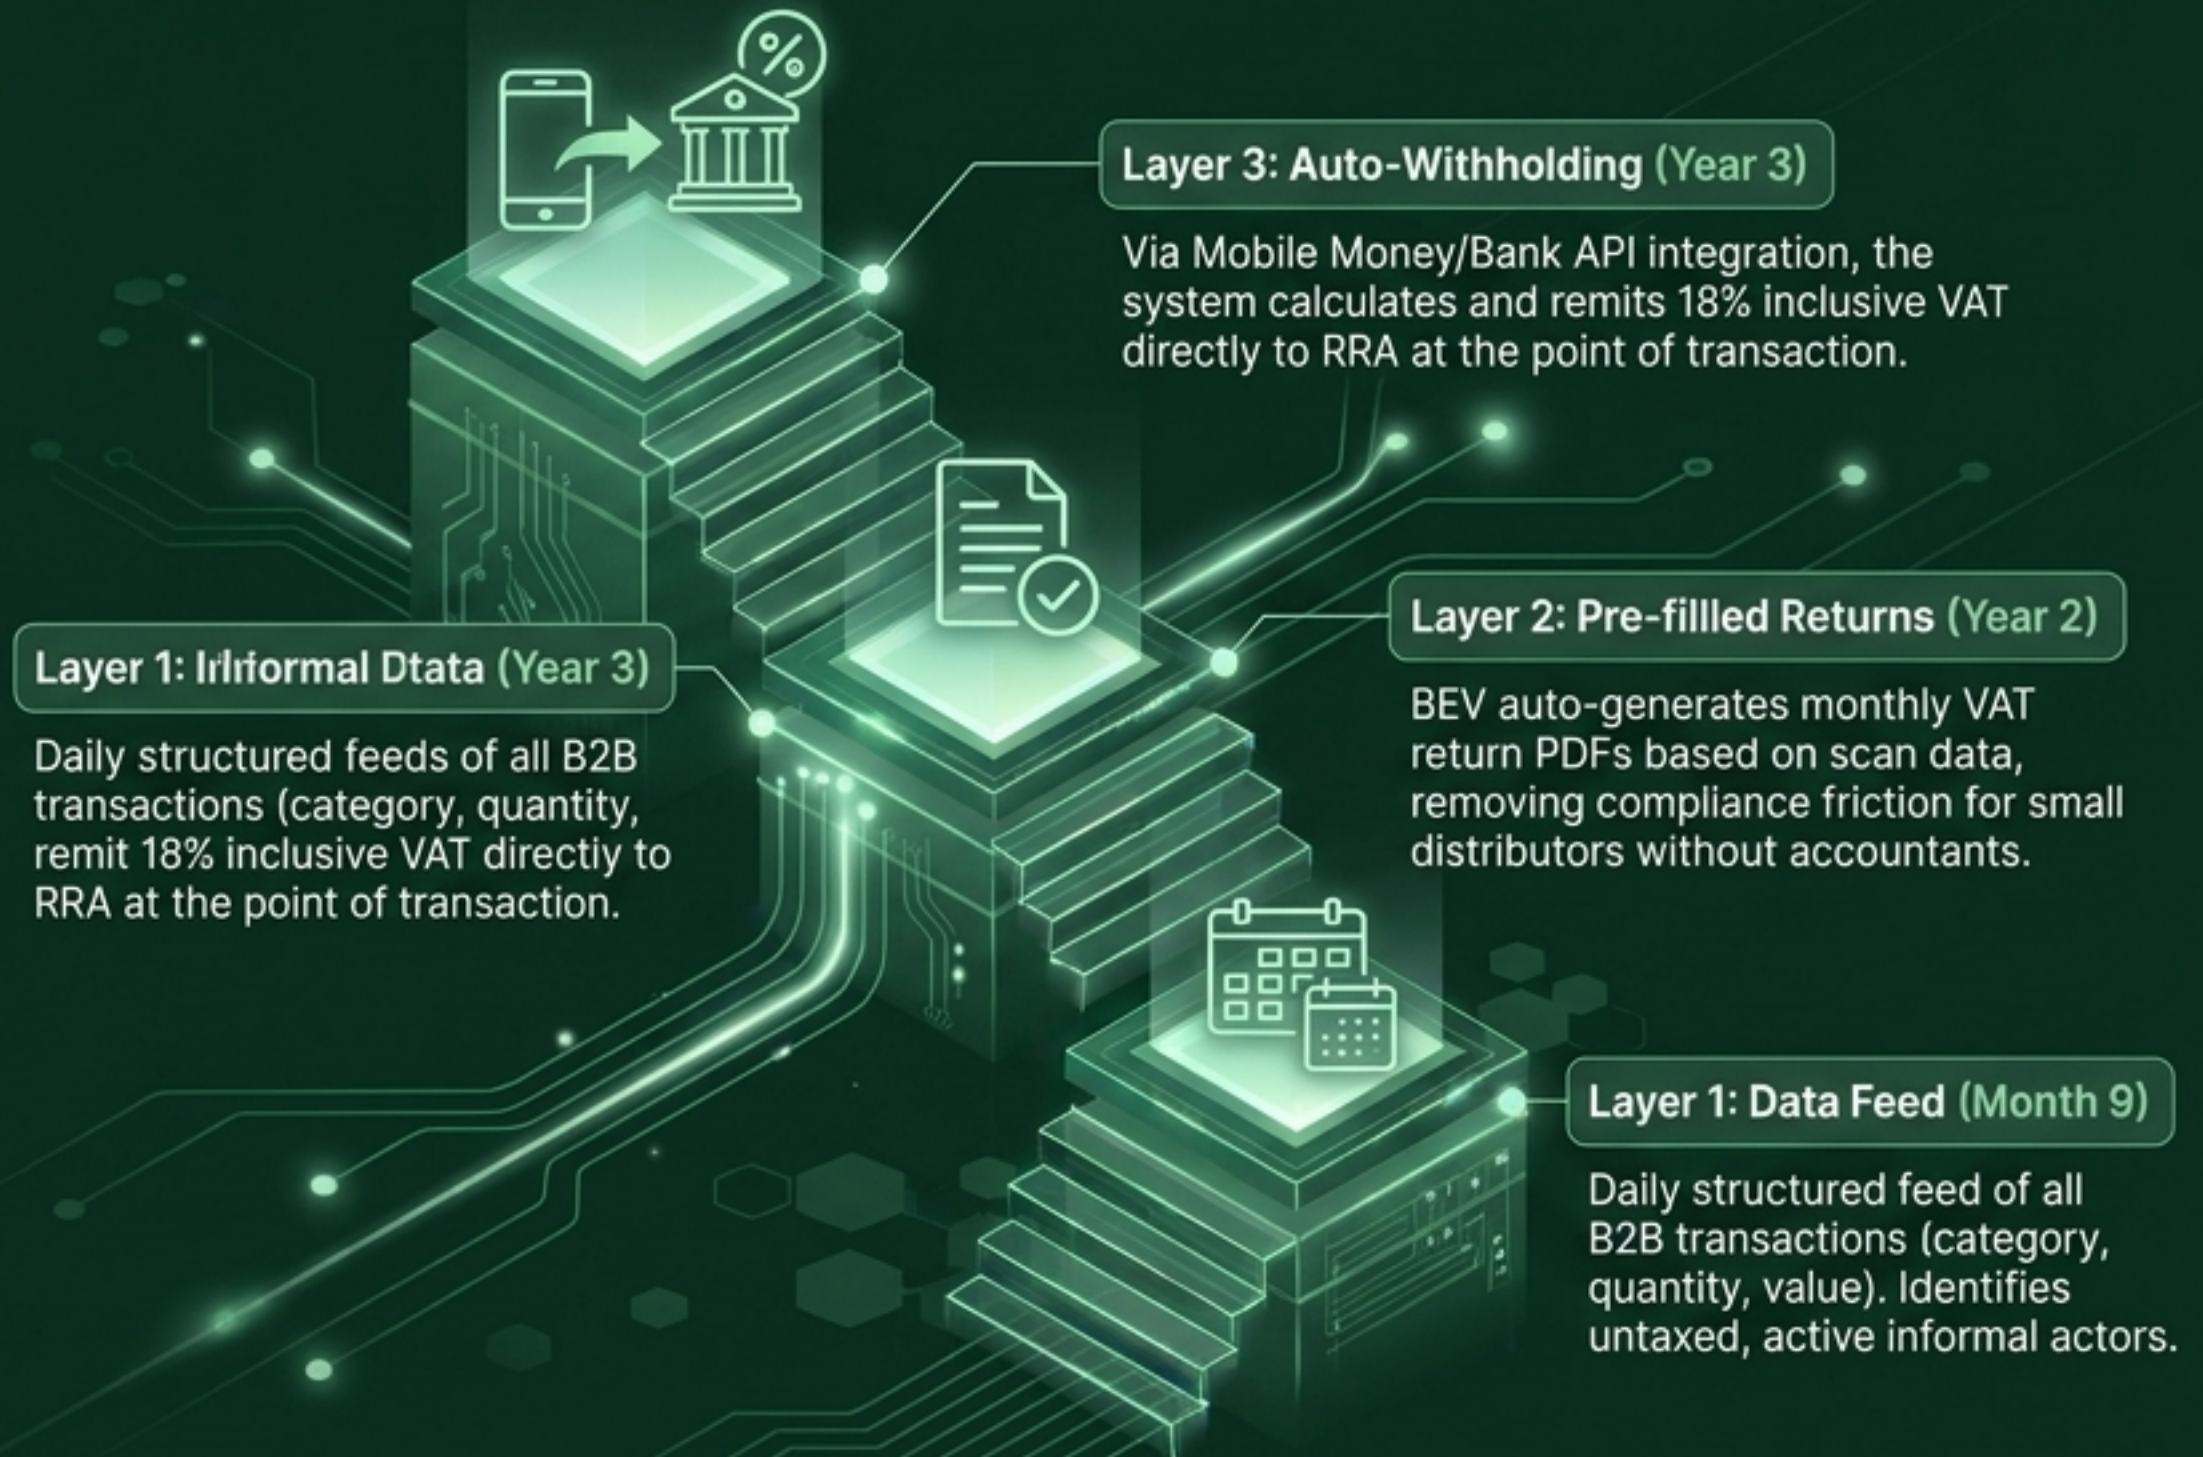

Moves from field-visits and phone calls to instant, targeted notifications to every recorded holder of a contaminated batch by name and quantity.

Evidentiary Base

The append-only ledger provides a court-admissible, cryptographically signed audit trail for enforcement.

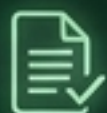

We progressively formalize the 80% invisible trade through a 3-layer tax integration.

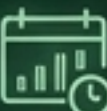

Verified supply chain data unlocks zero-collateral financing and sovereign industrial intelligence

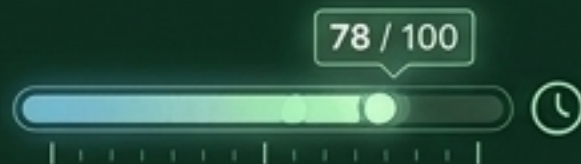

RSSB: Financial Inclusion & SME Formalization

The trading record becomes the asset.

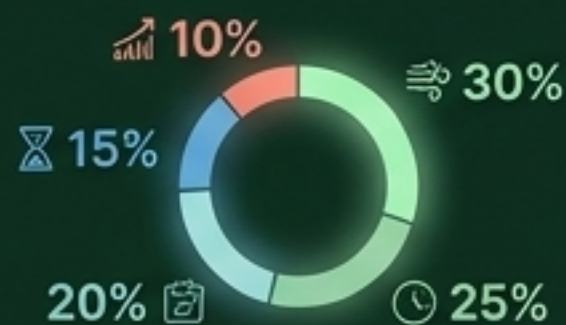

180 days of scan history unlocks a dynamic Credit Score (0-100).

Algorithm weighted by:

- Volume (30%)
- Velocity (25%)
- Scan compliance (20%)
- Stockout frequency (15%)
- Discrepancy rate (10%)

Distributors are incentivized to join the formal economy to access inventory financing.

MINICOM: Industrial Policy Intelligence

Generates a highly granular, real-time demand map by product, district, and channel.

Surfaces supply shortages instantly to direct manufacturing incentives.

Transforms Rwanda into a uniquely legible investment destination.

A mandate-driven adoption flywheel creates a self-sustaining ecosystem of value.

The White Space Synthesis

No company simultaneously provides cryptographic product identity, consumer authenticity, trade credit scoring, and government compliance infrastructure.

BEV owns this intersection.

1. Mandate

Rwanda FDA requires BEV serialization for market authorization. Manufacturers comply.

2. Incentive

Distributors organically join and scan rigorously because the credit engine rewards them with financing they cannot get elsewhere.

3. Visibility

This continuous, incentive-driven scanning generates the data RRA needs for tax formalization and MINICOM needs for policy.

Manufacturers do not pay. Consumer protection naturally subsidizes financial inclusion.

We plan a Proof of Concept (POC) with Inyange Industries to validate the concept before proposing full national adoption.

Phase 1: POC Planning & Development

Define POC scope and develop core components (basic portals, APIs, ledger, QR) for the Inyange pilot.

Phase 2: Inyange POC Execution

Execute the pilot with Inyange, engaging with FDA framework for mapping to state architecture.

Phase 3: National Adoption Strategy

Leverage POC results to propose full country adoption and secure SaaS contracts.

Proposed Inyange POC Validation

Inyange Factory

Distributor

Retailer

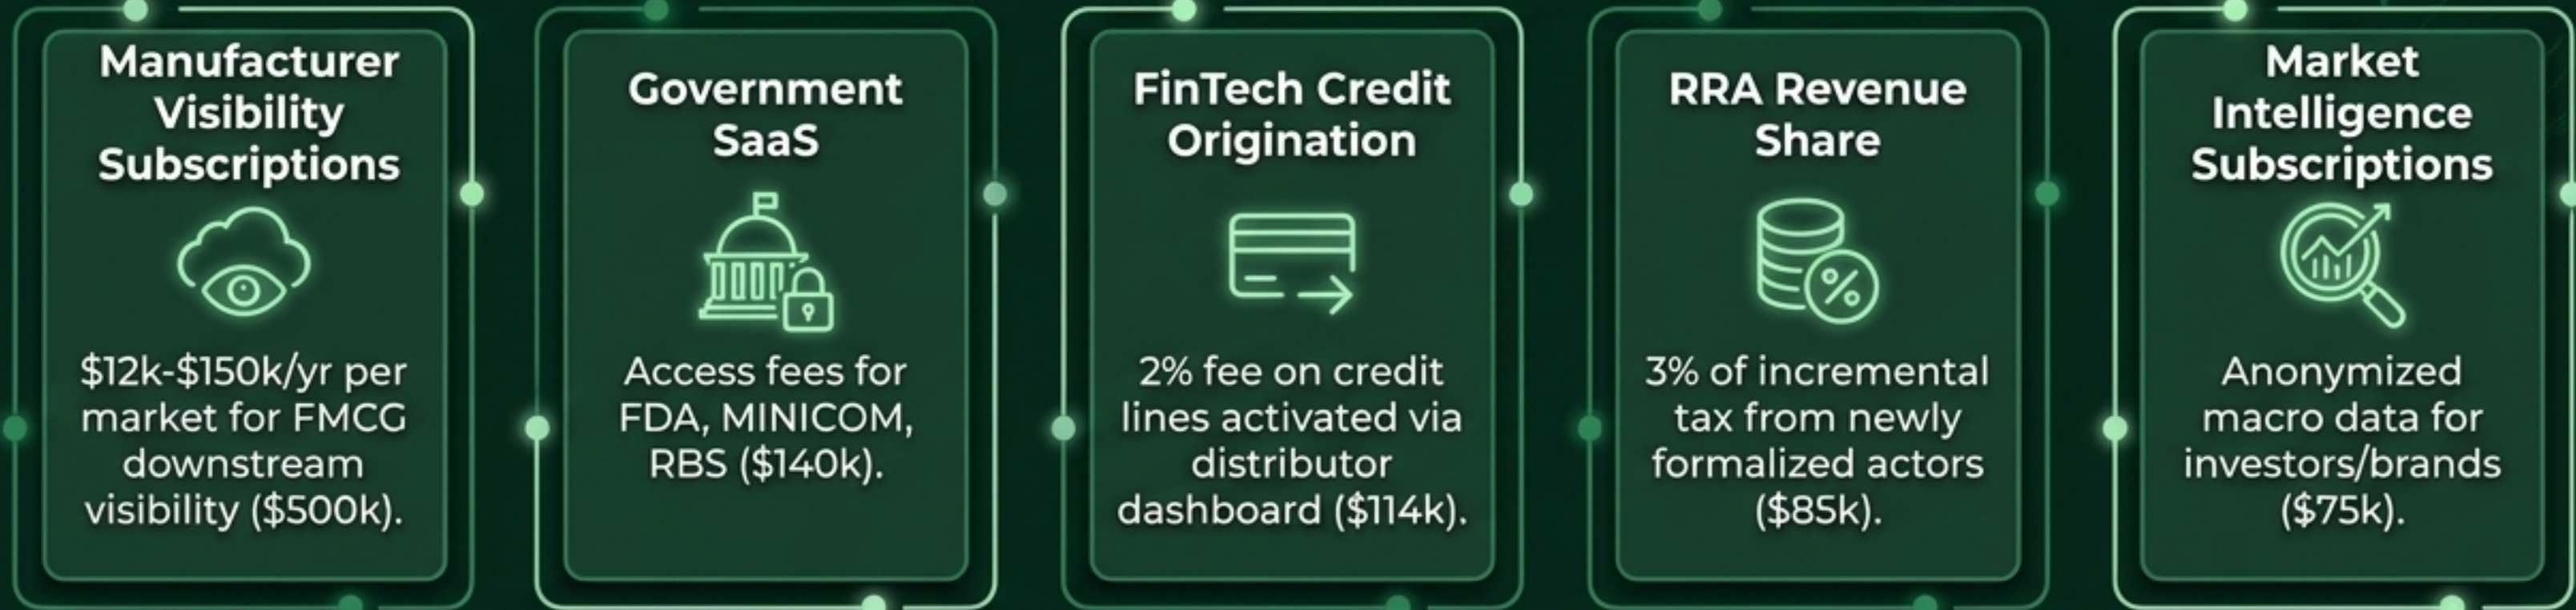

Consumer verification

- Will confirm print-ready QR integration directly into packaging label artwork (No hardware required).
- Will demonstrate full supply chain custody: Inyange Factory → Distributor → Retailer → Consumer verification.
- Anti-counterfeit proposition to be demonstrated to Rwanda FDA.

Our business model monetizes the institutional value of data, reaching profitability by Month 14.

Five Diverse Revenue Streams (Year 1 Est.)

Three-Year Projections

Year 1: **\$913k** Revenue >>

Year 2: **\$3.07M** Revenue | **49.4%** EBITDA Margin >>>

Year 3: **\$7.87M** Revenue | **76.3%** EBITDA Margin >>>

Base Case: EBITDA Positive by Month 14

Over three years, the platform evolves from a transactional ledger into a compounding national asset.

Year 1: The Ledger

Every scan event recorded. Append-only. Permanent. Sovereign.

35%

Capacity 

Year 2: The Intelligence

Dataset density unlocks automated inventory velocity tracking, expiry prediction, smart restock triggers, and RSSB credit scoring.

65% Capacity 

Year 3+: The National Asset

The reservoir achieves critical mass, providing real-time demand mapping across every district, product, and channel. Industrial policy built on live evidence, not delayed surveys.

100% Capacity

We are raising **\$500,000** to launch commercial deployment and scale operations.

The Seed Round Parameters

- Raising: \$500,000 for 20% equity.
- Valuation: \$2.0M Pre-money / \$2.5M Post-money.
- Target: Implied Series A at 10x Year 2 ARR (\$30.8M Pre-money).
- Capital Allocation: Finalizing engineering scale, front-loaded marketing/sensitization, and government/enterprise sales architecture.

Rwanda's supply chains will be digitized. We invite the government to build this infrastructure natively.

What We Ask of the Government (Zero Cost Policy Decisions)

Multi-Agency Working Group

A structured session to align FDA, RBS, RSSB, RRA, and RDB mandates with platform capabilities.

Regulatory Recognition

Formal policy recognition of BEV Digital as an authorized product authentication system.

Introduction to State-Owned Manufacturer

Facilitate an introduction to a state-owned manufacturer to aid in POC.

Letter of Interest for Capital Raise

Letter of Interest to facilitate capital raise to enforce the POC in the next quarter.

Strategic Introductions

Strategic introductions to aligned government players and private investors in the space.

**BEV Digital is that inside platform.
We are already here. We are asking to build together.**
